

BSR-3113

Barium Sulfate Remover

BSR-3113 is a one step proprietary blend designed specifically for the removal of Barium sulfate.

BSR-3113 Breaks down the structure of BaSO₄ and agglomerates it, making the smaller particulates easier to remove.

BSR-3113 is also very effective for CaSO₄ removal.

BSR-3113 has been designed to work in an optimum time of as little as 24 to 72 hours in environments with low bottom hole temperatures where thermals are not adequate enough to aid in a sufficient removal of Barium sulfate build-up.

BSR-3113 dissolves BaSO₄ at 0.2 to 0.4 lb. per gallon removal rate.

BSR-3113 is used to circulate wells by pumping via the tubing or via the casing to remove Barium sulfate deposition that may have accumulated in the near well-bore area and the pump area. This technique cleans and prepares the tubular goods prior to moving in workover rigs.

Specific Gravity:	1.14
Appearance/Odor:	Light Amber/Ammonia
Solubility:	Water

See MSDS

BSR-3113 is recommended at a volume of 2 to 5 times the casing volume of the net area to be treated. Samples should be obtained to determine that each individual well has the proper loading.
